Readership: Computer scientists. keywords: Research was carried out on an electro-optical bound document scanner which used a general purpose F-8 microcomputer as the scanner controller. The goal was to replace the F-8 with a dedicated controller by replicating essential features of the system which provided the scanner/controller interface. A microprocessor-based configuration was considered to be the most promising approach. A detailed analysis of the existing hardware and software interface between the F-8 and the scanner was conducted to establish the feasibility of using a microprocessor and to develop controller design criteria. Features of a number of microprocessors were examined and compared against one another to determine the best architecture for this application. From the participation of researchers in most important international conferences in the field, it is noted that activities in automatic document processing have been continuously growing. This book is an edited volume in Digital Document Processing where the chapters are written by several internationally renowned researchers in the domain. It will be useful for both students and researchers working on various aspects of document image analysis and recognition problems. It contains chapters on topics that are not covered by any textbook, but are more futuristic like "Going beyond the Myth of Paperlessness", or interesting application areas like "The Role of Document Image Analysis in Trustworthy Elections" as well as "Word Recognition for Museum Index Cards with SNT-Grid". Persons developing document analysis software for industry may also find the chapters useful and attractive. The language of the chapters is simple and clear, along with drawings/diagrams wherever necessary. An adequate number of references are given at the end of each chapter. Overall, the book is highly readable and will be an asset to the community. Renowned contributors include George Nagy, Hiromichi Fujisawa, F Kimura, D Lopresti, Chew

chapters cover gaussian beam characteristics, system lens design, and image quality, forming a framework that clarifies and serves the scanning process. Subsequent chapters cover the physical scanning methods holographic, polygonal, galvanometric, resonant, acoustooptic, electrooptic Research was carried out on an electro-optical bound document scanner using a charge-coupled device (CCD) as a sensing element. The goal was to develop a means whereby the voltage threshold level of the video analog-to-digital converter could be set automatically to provide optimum hard-copy output over a range of lighting conditions and document background colors and qualities. To determine an acceptable component of the analog video signal as a thresholding reference, an extensive study of the signal behavior was conducted over a variety of conditions. An Automatic Threshold Control (ATC) was designed that exploited the modulation transfer function of the CCD's analog signal. A CALIBRATION PATTERN is superimposed at the left-hand margin of the page being scanned. This pattern contains various discrete spatial frequencies. The threshold voltage is varied automatically until the number of black/white (zero/one) transitions is maximized for the CALIBRATION PATTERN. The threshold voltage producing this maximum number of transitions is equivalent to the threshold required to produce optimum resolution in the scanner hard-copy output. This threshold value is then locked in for the duration of the page being scanned.
