Diesel Engine Active Braking Control Design for Road Vehicles focuses on two main
brake system technologies: hydraulically-activated brakes with on-off dynamics and
electromechanical brakes, tailored to brake-by-wire control. The physical
differences of such actuators enjoin the use of different control schemes so as to
be able fully to exploit their characteristics. The authors show how these different
control approaches are complementary, each having specific peculiarities in terms of
either performance or of the structural properties of the closed-loop system. They
also consider other problems related to the design of braking control systems,
namely: • longitudinal vehicle speed estimation and its relationship with braking
control system design; • tire-road friction estimation; • direct estimation of
tire-road contact forces via in-tire sensors, providing a treatment of active
vehicle braking control from a wider perspective linked to both advanced academic
research and industrial reality. For sales or pricing inquiries outside of the
